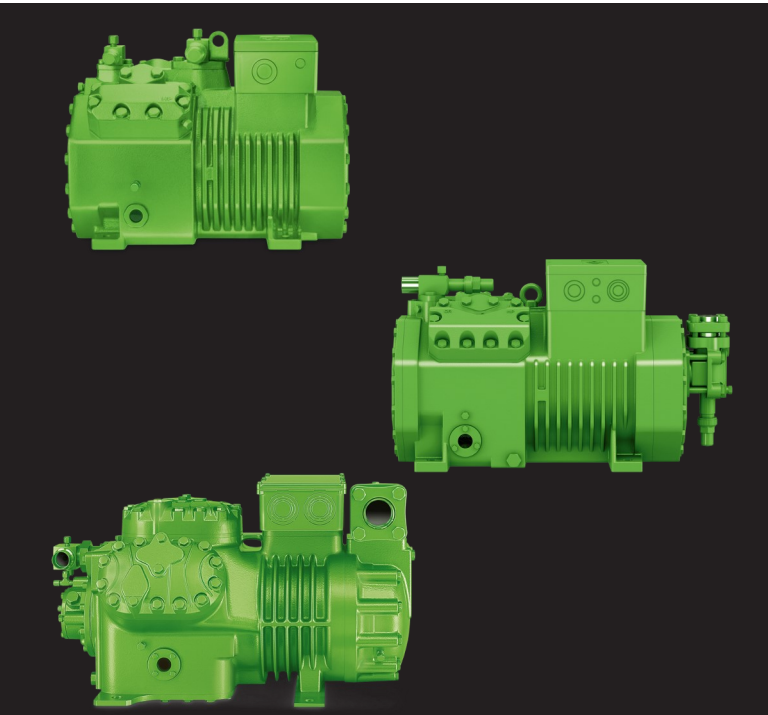
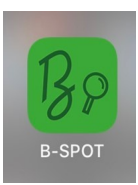
SERVICE GUIDE
ECOLINE COMPRESSORS

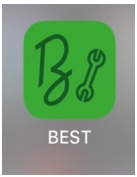


SG-0012-09 // Revision 3/2021 // IP

The BITZER REFRIGERANT RULER enables easy and fast determination of refrigerant data. The app contains all common refrigerants, including key fluid properties, safety group information, global warming potential (GWP), ozone depletion potential (ODP), and information on choice of oil type for the compressor. The tool provides an intuitive user interface for easy and accurate temperature-to-pressure conversion, while allowing easy to use and switching between different metric (SI) and imperial (IP) units.



The whole world of BITZER in your pocket: with the free BITZER SPOT app you can check whether any of the company's products is genuine—easily, directly and at any location. With this app, the specialist for refrigeration compressors offers its customers effective protection from system failures and high costs. Product piracy is no longer an issue for BITZER's business partners. They can simply scan the QR code on BITZER products and can immediately see whether it is an original BITZER product or whether it may be potentially dangerous copy.



This is the App edition of the BEST SOFTWARE (BITZER Electronics Service Tool) for connecting to BITZER IQ products that support Bluetooth. Quickly configure the device, monitor the operations and view the alarms including alarm help texts. Furthermore, the datalogs can be retrieved from the device. The datalogs can be uploaded to the my BITZERcloud for storage and sharing with other devices and peoples.

Supported Products

- IQ Module CM-RC-01
- IQ Module CM-SW-01
- CSV
- ECOSTAR

The intention of this document is to serve as general guidelines. The information contained is not intended to replace specific equipment and/or system manufacturer's information or guidelines. BITZER implies no liability for the information contained. It is BITZER's implicit intention that nothing contained in this guide replaces any past, present or future warranty policy of BITZER and/or any other manufacturer's equipment

These guidelines are not a replacement for information specific to that of the manufacturer or the manufacturer's system technical product information.

Each system may vary in design, usage and specifications. This document is intended for use specific to the compressor only and not intended to be a "catch all" for any and every possible application of the compressor.

BITZER's intention is that only qualified and certified (where applicable) individuals specific to the refrigeration industry use the information contained and all standard refrigeration handling and safety practices must be followed at all times.

BITZER's intention is that all electric work is performed by qualified and certified (where applicable) individuals and all standard electrical safety practices must be followed at all times.

General safety references:

Warning!
The **compressor is under pressure** with a holding charge of 14 psi above atmospheric pressure. Incorrect handling may cause injury to skin and eyes. Wear safety goggles while working on compressor. Do not open connections before pressure has been released.

Caution!
During operation, **surface temperatures** exceeding 140°F or below 32° F can be reached. Serious burnings possible. Lock and mark accessible sectors. Before working on the compressor: Switch off and let cool down.

Warning!
If working on the compressor after the plant has been commissioned: Compressor is under pressure! In case of improper handling serious injuries are possible. Release the pressure in the compressor! Wear safety goggles!

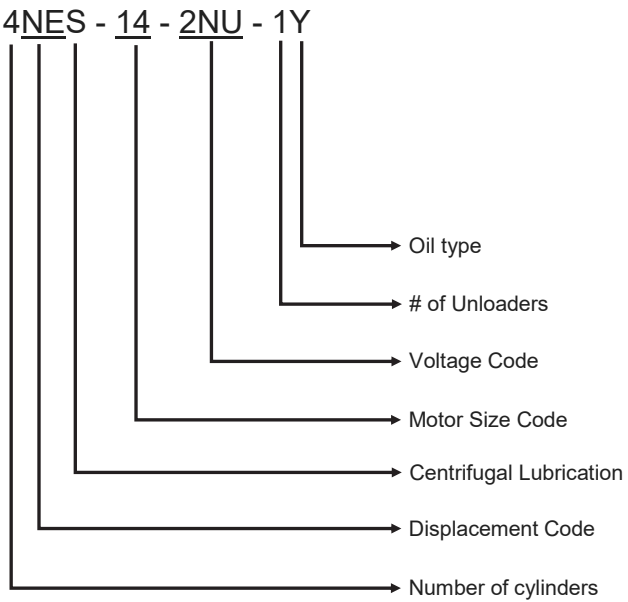
1.2 ECOLINE Nomenclature



Note: The suffix (e.g.“-1Y”) is used for ordering and shipping purposes but is not displayed on the data tag (nameplate) of the compressor. Y= POE D= dry

1.3 Serial Number Significance starting 01/09/2003

The serial number contains 10 figures. The first 2 digits indicate the *factory*, the 3 following digits indicate the *manufacturing date*, and the last 5 digits are running subsequently. ***Factory codes*** are the first 2 digits of the serial number (see Table 1). ***Date Codes*** are **the next** 3 digits that indicate the manufacturing date

Table 1: Factory Codes	
10	Rottenburg - Germany
11	Hailfingen - Germany
16	Schkeuditz - Germany
12	Castelo Branco - Portugal
13	Sao Paulo - Brazil
15	Milton Keynes - UK
17	BBR - China
18	Capetown - South Africa
20	BCB - China
21	Jawa Barat - Indonesia
22	St. Marys - Austrialia
23	Sunshine, Vic- Australia
24	Point Claire - Canada
25	Flowery Branch, GA
27	Syracuse, NY

Table 2: Date Codes						
	2019	2020	2021	2022	2023	2024
Jan	961	981	001	021	041	061
Feb	962	982	002	022	042	062
Mar	963	983	003	023	043	063
Apr	964	984	004	024	044	064
May	965	985	005	025	045	065
Jun	966	986	006	026	046	066
Jul	967	987	007	027	047	067
Aug	968	988	008	028	048	068
Sep	969	989	009	029	049	069
Oct	970	990	010	030	050	070
Nov	971	991	011	031	051	071
Dec	972	992	012	032	052	072

Example: SERIAL NUMBER 2572100001		
DIGITS 1 AND 2	DIGITS 3 TO 5	DIGITS 5 TO 10
FACTORY CODE	DATE CODE	SUBSEQUENT NUMBERING
25	983	00001
Flowery Branch	Mar –2020	Unambiguous subsequent numbering

1.4 BITZER Quick Ship Program

QUICKSHIP

Placing your Order:

- Call 770-503-9226 M-F from 8am - 5pm
- Call 1-888-GO BITZER (1-888-462-4893)

Choose from 4 Shipping Options:

- Next Day Delivery
- Second Day Delivery
- Standard Ground Transportation
- Customer Pick-Up

Please provide the following information to our Customer Service Associates:

- Failed Model Number
- Serial Number
- Contact Name
- Contact Phone Number
- Email Address
- Ship to Address
- Is a liftgate needed?
- Credit Card Number
  (American Express / Visa / Mastercard)

1.5 BITZER Core Charge Return Policy

Contact customer service at 770-503-9226 or email RMA@bitzerus.com for a RMA form.

Please Note:

A credit card number (or a PO if you have a BITZER account) is required for the replacement compressor and core deposit. We will call you back with a delivery confirmation ASAP.

Once a Return Material Authorization (RMA) form is filled out, we will also arrange to have your failed compressor picked up. BITZER will pay the freight back to the factory and, as soon as it arrives at the Atlanta area plant, we will issue you a credit against your core deposit.

BITZER does not charge a core charge for your replacement compressor if you adhere to the following procedures:

1. After receiving your replacement compressor, you have 2 weeks to contact us to schedule the pick up of your core. If you fail to do so BITZER will execute the core charge on your current PO.

2. The compressor should be shipped fully sealed: Use blank offs or the service valves shipped with replacement compressor.

3. Attach Return Material Authorization form to the compressor. Your RMA form will be issued when placing your order.

1.6 Technical Support

If there has been more than one failure in a system, speak to an application engineer:

Contact technical support at 770-503-9226 or email techsupport@bitzerus.com

Please provide as much of the following information as possible:

- Model number
- Serial number
- Refrigerant
- Voltage
- Evaporating SST or Pressure
- Condensing SDT or Pressure
- Return Gas Temperature
- Liquid Subcooling / Liquid Temperature
- Discharge gas temperature
- Amp draw
- Oil pressure

See back page for system parameter.

1.7 ECOLINE vs Standard models

ECOLINE is 100% backwards compatible with existing BITZER recips (Dimensions on page 16)

2.6 Application Limits

Explanation of Application Limits Diagram of Semi Hermetic Reciprocating Compressors

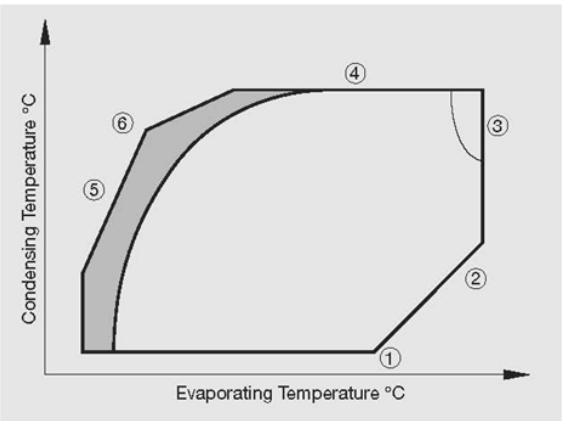

Figure 2.9.1.Simplified application limits diagram

Limitations of the application limits diagram:

1-Pressure differential / pressure ratio
If the pressure differential / pressure ratio of the compressor gets too low the resulting force is insufficient to properly open or close the reeds on the valve plate. This can lead to a breakage of the reeds. Furthermore the volumetric displacement decreases due to reverse expansion from the pressure chamber into the working chamber.

2-Maximum evaporating temperature
If the compressor operates at an evaporating temperature close to the maximum allowed evaporating temperature the compressor delivers a high refrigerant mass flow. Hence high forces develop on bearings and drive gear.

3-Motor Load
The motor load of a semi hermetic reciprocating compressor depends on the operating point. The higher the evaporating temperature and the higher the condensing temperature, the higher the corresponding motor load.

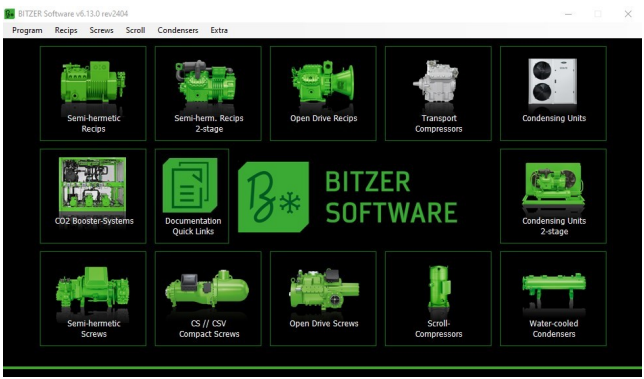
4-Maximum condensing temperature
The maximum condensing temperature is limited by the saturated vapor pressure as well as the maximum allowable operating pressure on the high pressure side of the compressor.

5-Minimum evaporating temperature
With decreasing evaporating temperature the saturated vapor pressure of the refrigerant decreases as well. For safe operation the circuit should not be operated at pressures too much below ambient air in order to avoid penetration of ambient air into the suction side of the system through a leakage.

At low evaporating temperatures the refrigerant mass flow of the compressor as well as the suction gas density are decreasing. This can possibly lead to an insufficient motor cooling as the delivered refrigerant mass flow is too low.

6-Thermal limit
At low evaporating temperatures in combination with high condensing temperatures the thermal load limit of the compressor restricts the operation. There are various possibilities to extend the application limits such as water cooled cylinder heads, additional fans, restricting the allowable suction gas superheat or, in individual cases, a direct liquid injection into the suction side of the compressor. The recommended methods for additional cooling are displayed in the application limits diagram as icons.

Semi-hermetic Recips
Application limits: See BITZER Software



The BITZER software helps you to design systems and select the right items from our extensive range of products. You receive all the desired information, technical specifications, calculation results and individually designed performance tables for compressors as a print-out or in PDF format. The program is very user friendly, available in several languages and offers lots of additional information.

2.7 Operating Parameters

Temperatures and Pressures

Parameter	min	max	nominal
Discharge Temp	SCT + 40°F (50°F w/R22)	250°F	--
Oil Temp	95°F (55°F > SST)	175°F	--
Superheat	15°F	--	20 - 30°F
Oil Pressure Diff	10psi	--	20 - 50psi

Electrical

Parameter	Trip	Reset	Ambient
Motor PTCs (M1 to M2)	≈4500Ω (≈280°F)	≈ 2700Ω	150 - 650Ω

Parameter	Terminal Pins		min	max
Motor Windings (3PU, 4PU, 5PU) (6 pin terminal)	1-7 2-8 3-9		.3Ω	2.0Ω
	Pin to ground		OPEN	
Motor Windings (2NU)* (9 pin terminal) *jumper bars removed	1-4 2-5 3-6	7-8 8-9 7-9	.3Ω	2.0Ω
	Pin to ground		OPEN	

Variable Frequency Drives

Parameter*	min	max
CE1, CE2, CE3	30Hz	70Hz*
CE4, BE5	25Hz*	70Hz*
BE6	30Hz	70Hz*

***Consult BITZER AE department for operation between 25-30Hz and 60-70HZ**

3.1 Electrical Data Terminology

TB-0056 clarifies BITZER's electrical ratings and recommendations for UL recognized compressors.

Maximum Continuous Current (MCC) and Rated Load Amperage (RLA)

All BITZER semi-hermetic compressors come standard with PTC temperature sensors (thermistors) embedded in the motor windings. The thermistors work with the motor protection module to provide an electrical overload and thermal protection system. As such, the motors comply with UL & NEC definitions of inherent thermal protection and have the wording "Thermally Protected" included on the compressor nameplate. The thermal protection system will not allow the compressor to run higher than the amperage value that is referred to as Maximum Continuous Current (MCC)

RLA = MCC / 1.40 vs. MCC / 1.56

A Rated Load Amperage (RLA) is used for sizing electrical components and unit ratings. Please consult the applicable standard, code, or guideline in appropriately applying the RLA. With motors that are thermally protected, UL and NEC require that a minimum of MCC / 1.56 be used as the RLA. In the past, a more conservative MCC / 1.40 has been used. Both values are given in the table.

**It should be noted that operating amperage can exceed the RLA value.*

Maximum Operating Amperage (MOA)

Maximum Operating Amperage is the maximum amperage that the compressor should ever draw based on the approved application envelope (normally at the maximum evaporating temp and max condensing temp for a given motor version). The values in the table correspond to the values found in the BITZER software. Please note that for 208V, the MOA may be a separate, higher value than 230V. MOA should be taken in to consideration when sizing electrical components including inverters.

Locked Rotor Amperage (LRA)

Locked Rotor Amperage is stated on the compressor nameplate. This value indicates the maximum current the windings will draw on start up or if the running gear is unable to rotate. For part winding motors, there are two values: the lower value is for a part winding start and the higher value is for a direct start (across the line). LRA should be used in verifying the correct sizing of contactors.

INVERTER SIZING

When sizing an inverter for a BITZER semi-hermetic compressor, it is important that the inverter has the available power to run the compressor at all pressures within the application envelope. For this reason, BITZER recommends that the inverter output amperage be greater than the compressor MOA × 1.1. If running the compressor at a frequency higher than the power supply frequency (trans-synchronously), then additional power / current must be available in the motor of the compressor. Please consult the application engineering team (techsupport@bitzerus.com).

Please note, when sizing electrical components and unit ratings, the ***rated input current*** of the inverter should be used rather than the compressor RLA or MOA. This is because the equipment power is connected directly to the inverter, not the compressor. For this reason, we only supply this value for our VARISPEED compressors. This value may also be used as the Maximum Rated Current (MRC) as mentioned in UL1995.

CONTACTOR AND CIRCUIT BREAKER SIZING

Applicable standards, codes and guidelines, should be used to establish minimum electrical component sizes. The minimum allowable electrical component size should be compared with the compressor MOA to avoid compressor reliability issues and nuisance tripping.

Undersized contactors can result in increased pitting and wear of the contact surfaces. In order to avoid possible compressor motor failure due to undersized contactors, BITZER recommends sizing the contactor using the more conservative factor, MCC / 1.40 **,** or by using the MOA (whichever is higher). The contactor's locked rotor rated current must also be sufficiently higher than the compressor LRA. It is recommended to consider a safety factor to account for higher voltages than the nominal rating voltage (e.g. 10%).

Nuisance tripping of the circuit breaker can occur if sizing strictly on RLA. For this reason, the MOA should be considered when sizing the circuit breakers. For example, the selection should be at least 110% of MOA or even up to 125% of MOA (when possible based on applicable standards or codes).

RUNNING LOAD AMPERAGE

RLA is often mistaken to represent "running load amperage," which is sometimes used incorrectly in place of the actual "Rated Load Amperage". The "running load amperage" should not be used for sizing of any electrical devices. The "running load amperage" indicates the current that the compressor is pulling at a specific condition. This value can be found in the BITZER Software by selecting the desired compressor, inputting the exact conditions (SST/SDT etc.), and noting the "Current" which is shown under the "Results" tab. It is important to adjust for actual voltage as this "Current" value is only applicable for the indicated nominal voltage.

For further information contact BITZER US Application Engineering at (770) 503-9226 or techsupport@bitzerus.com.

IQ MODULE // CM-RC-01

IQ INTELLIGENT PRODUCTS

BITZER SOFTWARE

As the perfect complement to the tried-and-tested BITZER semi-hermetic reciprocating compressors, the CM-RC-01 compressor module monitors and (operates) manages the important operating parameters of a compressor and thus ensures safety, simplicity, and flexibility.

Model Range

- ECOLINE: 4FES-3(Y)… 8FE-70(Y)
- ECOLINE CO_2 : 4PTE-6K...6CTE-50K
- ECOLINE+ CO_2 : 4PTEU-6LK...6CTEU-50LK

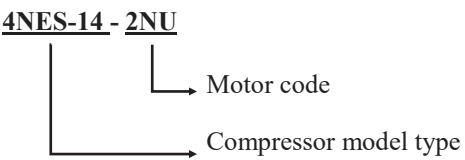
3.3 UL Motor Codes

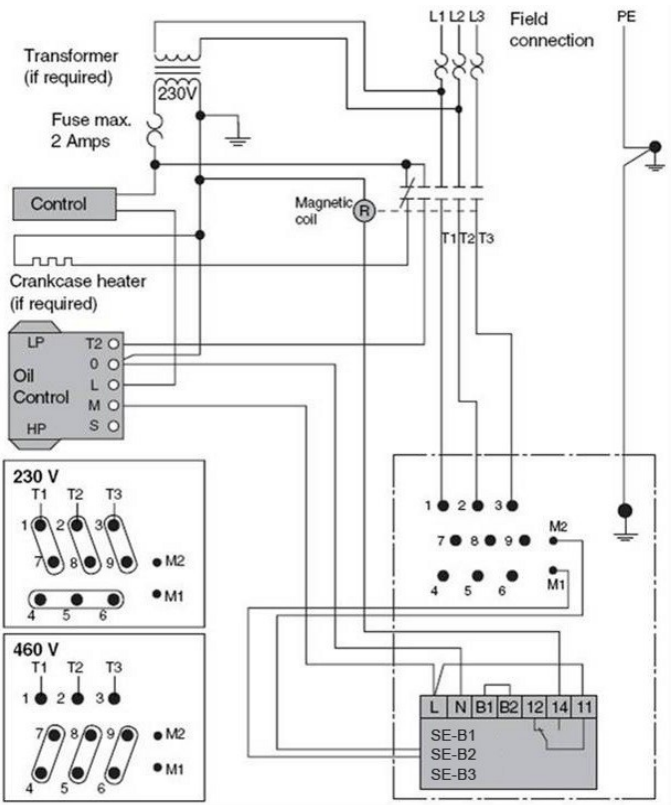
Compressor Model	Motor Code	Nominal Voltage	Voltage Range	Motor Connection
CE1, CE2, CE3 (2KES .. 4CES)	2EU	208 / 230	208 - 230	1 Phase
	2DU	208 / 230	208 - 230	D
	4SU	460	440 - 480	Y
	5SU	575	575	Y
CE4, BE5, BE6 (4VE .. 6FE) **2-Stage** (S4-S6)	2NU	208/230	208 - 230	Y/YY (Dual voltage)
	2NU	460	440 - 480	Y (Dual voltage)
	3PU	380	360 - 400	Y/YY
	4PU	460	440 - 480	Y/YY
	5PU	575	575	Y/YY

Example:



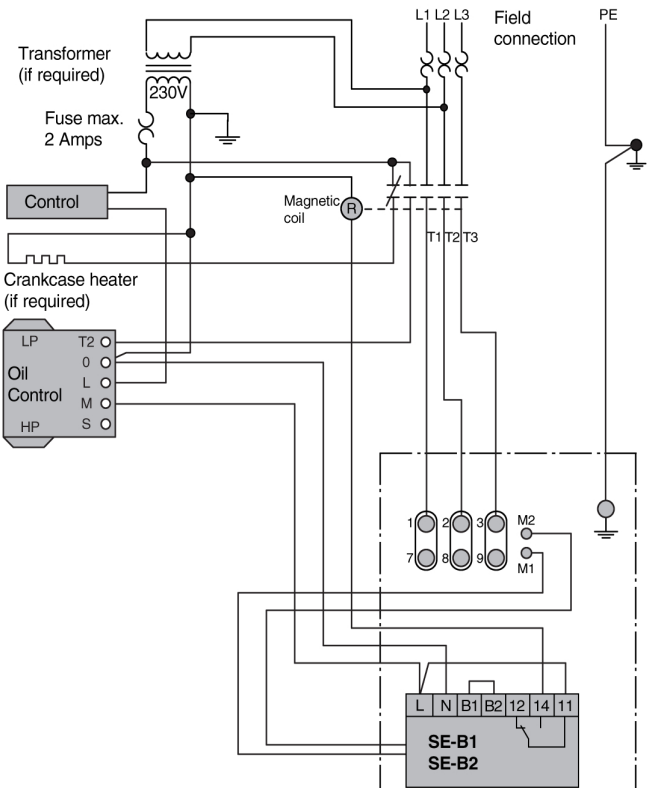
Legend:
Y or S = Star wiring
D = Delta wiring
P = Part winding
N = Dual Voltage
U = UL approval
Y/YY = part winding option available
Note: All motor information listed for 60Hz

3.4 Wiring Diagrams / Power Connection
Direct Start
2NU Motor 230V or 460V/3/60Hz



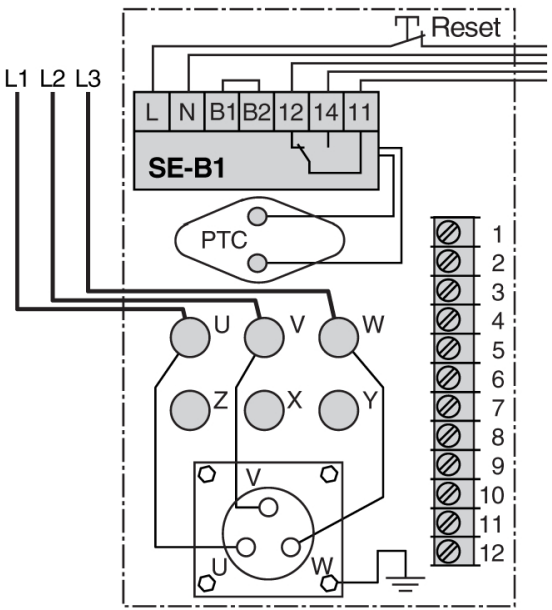
ATTENTION! Terminals B1- B2, M1- M2 and cables 1-2 must not come into contact with supply or control voltage.

Direct Start
4PU Motor 460V/3/60HZ & 5PU Motor 575V/3/60

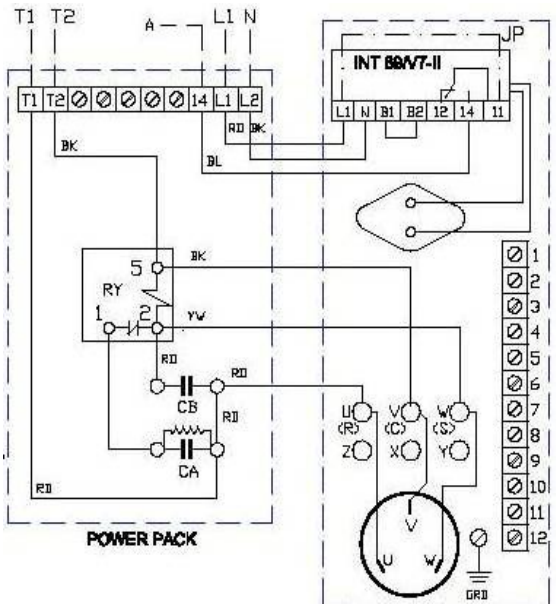


ATTENTION! Terminals B1- B2, M1- M2 and cables 1-2 must not come into contact with supply or control voltage.

Direct Start
2DU 230V/3/60HZ, 4SU 460V/3/60HZ & 5SU 575V/3/60HZ



ATTENTION:
Do not supply voltage at the PTC terminals



Legend

A = Comp. control circuit
CA = Start capacitor
CB = Run Capacitor
JP = Field installation jumper (req'd)
RY = Start relay
T1/T2 = From compressor contactor
B1/B2 = Remove B1/B2 to enable "automatic reset" mode

ATTENTION:
Do not supply voltage at the PTC terminals
Bleed Resistor = 15000Ω

4.1 Protection Devices

Protection Module Part Numbers and Pictures

Protection Module	Part Number	Picture
INT: SE-B3 (Motor)	347035-01	
OLCD-1 **CMRC ONLY** OLC-K1 (Oil)	…… 347318-07 (110V) 347318-06 (230V)	Delta-P I **CMRC ONLY** Delta-P II (Oil) FOR CO_2 ONLY	…….. 347318-11 (110V / 230V) 347319-16 (110V/230V)	
SE-B3
When installing a dual voltage INT, the service tech should conduct the following tests to ensure proper operation:

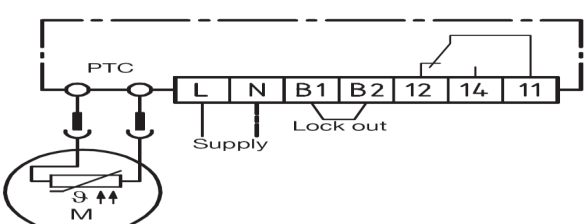
- WITH THE POWER OFF, remove one of the leads from either M1 or M2 on the compressor terminal board.
- Turn on the power and confirm that the control voltage appears between terminal 12 and N on the device.
- If an optional signal light (H1) is used, it should be illuminated.
- NO voltage should appear between terminal 14 and N.

Please Note: After supplying power between L and N, there will be a 3-second time delay.

Manual Reset
A manual reset function prevents the compressor from restarting and eliminates short cycling. This can be reset by briefly interrupting the supply voltage for 5 seconds, either by means of the main switch or by a reset push-button which can be installed in the supply line.

Automatic Reset
In exceptional cases, the lockout function can be cancelled by removing the link between B1-B2. The compressor then restarts automatically after cooling down. This modification is only permissible if the cycling rate is limited to 6-8 starts per hour by using an additional time-lag relay or timer.

Note: INT trips at 4500Ω
The typical resistance at ambient conditions for M1 and M2 is 150Ω - 650Ω.



Oil Monitoring Devices:

Delta-P II: Monitors oil pressure differential of compressors with oil pumps

OLC-K1: Optically monitors oil presence at the crankshaft of centrifugal disk (“S”) compressors
Delta-P I Oil Pressure Differential for CM-RC Only

Technical Features:

- The Delta-P and OLC consists of two parts: a sensor unit and an electronic unit.
- Because the mechanical component screws separately into the BITZER housing, the hermetically sealed electrical unit can be replaced without refrigerant or oil loss.

Device Trip:
Delta-P:

- If the differential oil pressure drops below 9.5 ± 2 psid (for any amount of time) a red light will illuminate on the front of the electrical unit.
- If the pressure remains below for 9.5 ± 2 psid for longer than the allowable time (see chart on p.70) then the output relay opens (stopping the compressor).

OLC:

- If there is no oil present for any amount of time in the oil pocket (center of front bearing cap), a red light will illuminate on the front of the electrical unit.
- If no oil is sensed for longer than the allowable time (see chart on p.70) then the output relay opens (stopping the compressor).

Delta-P / OLC-K1:

- In case the supply voltage is too low or if the electronic unit is not properly mounted, the device will lock out after 5 seconds. The LED at the front end of the electronic unit will flash.

LED indications:

- LED is off: Sufficient oil supply
- LED is on (red): Insufficient oil supply (presently)
- LED is flashing (red): Fault (Voltage or installation)

Manual Reset
Interrupt power supply for at least 5 seconds.
Note: Always try to diagnose the issue in the event of an oil trip instead of repeatedly resetting the device. (Tip: View the red LED indicator to see if oil is intermittently dropping out)

Wiring (see following page):
The Delta-P II and the OLC-K1 have identical wire connections:

- Brown and Blue are the main power and used for resetting.
- Gray and Orange are the relay (should be in series with the control circuit). They will close when there is power to the unit and the oil supply remain sufficient (see chart for trip delays)
- Pink is the alarm part of the relay. Gray and Pink will close during an oil trip or when there is no power to the unit.
- Violet is a run proof to start the timing sequences. This must have power only when the compressor is on (typically uses the N.O. auxiliary contacts of compressor contactor).

Troubleshooting Tip:
If there is a similar compressor adjacent, unscrew electrical units and temporarily swop to see if the issue stays with compressor or device.

Delay Times	Delta-P II	OLC-K1
After Compressor Starts	5s	90s
In Operation	90s	5s

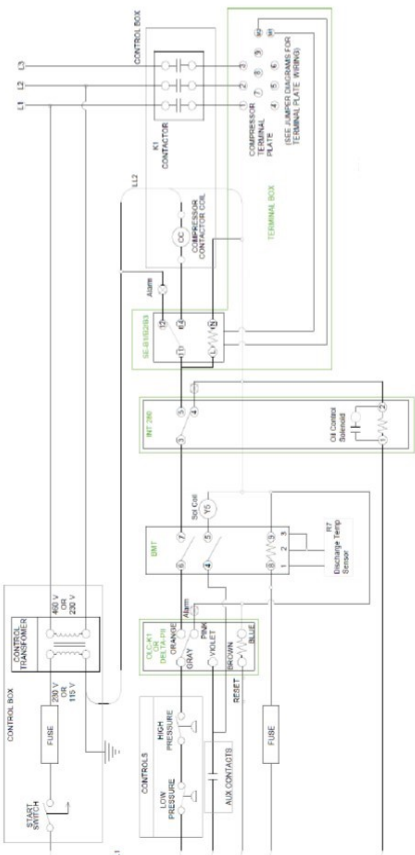
K2T ....Time relay "pause time" 300 s
M1 .....Compressor
Q1 .....Main switch
R1-6 ..PTC sensors in motor windings
R7 .....Discharge gas temperature sensor (option)
R8 .....Crankcase heater (option)
S1 .....Control switch
S2 .....Fault reset "over temperature (motor / discharge gas)"
S3 .....Fault reset "lack of oil"
U1 .....EMC screening unit (if required)
Y1 .....Solenoid valve "start unloading" (option)
Y2 .....Solenoid valve "liquid line"
Y3 .....Solenoid valve "capacity control" (option)

Using the OLC/K1 or Delta-PII Oil Control

- Brown and Blue are the main power and used for resetting.
- Gray and Orange are the relay (should be in series with the control circuit). They will close when there is power to the unit and the oil supply remain sufficient (see chart for trip delays)
- Pink is the alarm part of the relay. Gray and Pink will close during an oil trip or when there is no power to the unit.
- Violet is a run proof to start timing sequences. This must have power only when the compressor is on (typically uses the N.O. auxiliary contacts of compressor contactor).



4.2 Other Oil Monitoring Devices and Adaptors Part Numbers

Compressor Model	Other Oil Monitoring Devices and adaptors			Pressure differential		Sight Glass Oil Level
	Oil Safety Type	Part Number	Lubrication Type	Mini-mum	Nominal	
CE1 (2KES .. 2FES)	Oil Float Adapter	990-8000-02	Centrifugal Disk	-	-	1/4 to 3/4 Full

1 gallon = 3.78 liters

Note: When changing oil, remove the oil strainer to inspect and clean.

4.4 Capacity Regulator

The BITZER capacity control is based on the principle of suction shut -off. Hereby the suction-side gas flow to the individual cylinder bank is shut off by means of a control piston.

In **Full-load operation** the compressor delivers on all cylinders. The solenoid coil is DE-ENERGIZED. The gas ports in the valve plate and cylinder head are opened.

In **Part-load operation** the pistons of the switched-off cylinder bank run idle without gas pressure. The solenoid coil is ENERGIZED, the suction port in the corresponding cylinder head is shut off by means of a servo valve.

Application limits with part load operation
With capacity regulator operation the temperature level rises due to:

- reduced refrigerant mass flow,
- reduced motor cooling and
- electrical and mechanical losses.

Therefore the application ranges of the capacity controlled compressors are restricted to some extent.

Attention! For low temp applications and open drive reciprocating compressors the use of capacity control is restricted.

Capacity regulator head kit (w/gasket and stem) part numbers:

Compressor Model	Unloader Head (w/ gasket & stem) Part Number:
CE3 (4FES .. 4CES)	302355-35
CE4 (4VE .. 4NE)	302355-34
BE5 (4JE .. 4FE)	302355-33
BE6 (6JE .. 6FE)	302355-33

***See KT-101 for CRII Capacity Control information.**

Compressor Type	Possible residual capacity*	Number of capacity regulators
4-Cylinder	50%	1
	10 - 100%	2
6-Cylinder	66%	1
	66% - 33%	2
	10 - 100%	3

6.1 Operating Temperatures and Oil Guidelines

Guide values for operating temperatures*

Operating Temperatures		
Suction gas superheat	min.	~15°F
	typical	20-30°F
Discharge gas temperature	min.	40°F above condensing temp. (50° F for R22)
	max.	250°F; measured at discharge line
2 Stage Intermediate (middle) pressure superheat	min.	~40°F+subcooler saturation temp; measured at bulb on MP line

*Values in practice depend much on operating conditions (A/C, medium temp., low temp.) and refrigerant! Please check individual cases with the selection software or BITZER.

Note: Compressor/Oil Pump rotates in either directions.

Guide values for oil maintenance

Oil Guidelines		
Oil temperatures - on Start-up**	typical	25-35°F above ambient
Oil temperatures - Operating	min.	95°F (min. 55°F > SST)
	max.	170°F
Oil pressure differential	min.	9.5 ± 2 psi (see p. 69 - 70 for oil monitoring devices)
Oil change		Every 3 years or 10000 hrs of operation

**Oil heater recommended.

Note: When changing oil, remove the oil strainer to inspect and clean.

6.2 Switching Frequency and Vibrations

Switching frequency and minimum running time

Nominal Motor (HP)	Starts per hour		Minimum running time (min)
	recommended	maximum	
up to 7.5	10	20	2
up to 20	8	12	3
above 20	6	6	5

Vibrations on the high pressure side

Vibrations on the high pressure side of refrigeration systems are mainly caused by: Pulsations, Structure-borne vibrations, Frame design / basement

Pulsations

Pulsations (longitudinal gas vibrations on the high pressure side) are created by the discharge process of the gas out of the cylinders. Their amplitude and frequency depend on:

- Compressor speed
- Number of cylinders
- Cylinder alignment
- Refrigerant properties (pressure, temperature and sonic speed)

Critical discharge gas vibrations can be found if the frequency of the oscillating gas column in a straight discharge tube section gets into resonance with the natural frequency of the pipework. In the worst case this could result in a fracture of the piping. The length of the pipe segment with a resonance frequency corresponding to the natu-

6.3 Tightening Torques for Screw Fixings of Non-Aluminum Reciprocating Compressors

OIL WHITE PAPER GASKETS
TIGHTEN SCREWS CROSSWISE AND AT LEAST IN TWO STEPS (50/100%)

6.4 Common Wrench Sizes for Basic Compressor Service

Bolt	Metric Wrench Size (mm)	Metric size in inches (decimal)	Metric size to closest inch (1/16")*
M5 HHC	8mm	0.315	5/16
M6 HHC	10mm	0.394	3/8
M8 HHC	13mm	0.512	1/2
M8 SHC	6mm (Allen)	0.236	1/4
M10 HHC	17mm	0.669	11/16
M10 SHC	8mm (Allen)	0.315	5/16
M12 HHC	19mm	0.748	3/4
M12 SHC	10mm (Allen)	0.394	3/8
M16 HHC	24mm	0.945	15/16

*** SAE standard equivalent wrenches may be used as a substitute for metric wrenches. Use caution as bolt may strip from incorrect tool size use.**

Legend
HHC = Hex Head Cap
SHC = Socket Head Cap

6.5 Cylinder head and valve plate replacement guidelines

1. Remove cylinder head bolts.
2. If a capacity regulator (unloader) is installed, remove the bolts holding the unloader stem as they are part of the cylinder head bolts.

3. Remove the cylinder head.
4. Remove the valve plate and inspect for damage.
5. Install a new valve plate gasket
6. Install a new valve plate.

Note: the new valve plate may look different than the original number of discharge reeds and diameter of holes may vary) - this is normal and will not affect performance.

- Use the dowel/guide pins to align and hold the gasket and valve plate correctly.

6. Install a new head gasket
7. Replace the cylinder head, tighten the screws crosswise and in at least two steps. Torque the screws to the appropriate force listed on page 85.

6.6 Troubleshooting

Observation	Possible Cause	Trouble Shooting Steps
Compressor is not running	Loss of power	Check voltage between phases before and after breaker, contactor and at the terminal box. Check voltage between the contactor coil.
	Overload protection (INT) tripped	Check resistance between M1 and M2. If resistance is lower than 1000 ohms, reset the INT. If the resistance is greater, check motor windings (see pg. 47 of this SG), supply voltage and ensure connections are tight. Check that all contacts on are making on contactor, line and load side. Compressor is run outside the application window resulting in high discharge temperatures.
	Motor Burnout	Check windings. Check continuity and resistance between windings. All windings should have the same resistance of about 1 ohm and should show continuity. Also check continuity and resistance between each pin and ground. Resistance should be at least 50 Megaohms (non-continuous).
	Other protections tripped	Check continuity for all control circuit devices (e.g. low/high pressure switches, phase loss, oil failure, etc)
Compressor is noisy	Broken reeds	Check suction and discharge pressure. Turn off the compressor and look for the pressures to equalize. If the pressures equalize almost immediately, change valve plate.
	Wet suction	Check superheat on the suction side of the compressor (superheat should be at least 20° F). Adjust TXV to the appropriate superheat.
	Broken rod	Check for heavy vibrations. Replace compressor.
Compressor leaking	Gaskets / o-rings	Tighten bolts accordingly to the torque chart, TB-0060-01. If the problem is not solved then change the gasket or o-ring. Inspect mating surfaces when changing gaskets. Only use BITZER gaskets / o-rings.
	Oil adapter / sight glass	Replace the oil adapter.

Situation	Possible Cause	Trouble Shooting Steps
Oil pump	Low Pressure differential	Minimum pressure differential is 9psi. Check compressor SH. Should be 20-30°F SH. Check oil level at the sight glass. Check pick up oil screen in crankcase on CE4 (4VE-6..4NE20), BE5 (4JE -15..4FE-35) BE6 (6JE-25..6FE-50) body style compressors. Reverse the rotation by changing two phases of the power supply, look for improvement. If no improvement, after these checks, change oil pump.
	No pressure differential	Open oil pump. Pull the oil pump and check oil pump PRV. If the oil pump bearing is worn, change the complete oil pump
	Oil level low	Add oil and check for leaks. On parallel compressor systems check oil management system. On single compressor applications check that the compressor does not operate at low load for extended periods of time. Low mass flow of refrigerant can cause poor oil return.
Flooded start	Crankcase heater	May not be operating or installed. Crankcase heater needs to remain on when compressor is off.
	Piping	Piping is allowing liquid to enter the compressor when the compressor is off. Change piping and/or install check valve. If the condenser is above the compressor a check valve needs to be installed in the discharge line.
	Migration	Ensure proper crankcase heating. If the compressor is outdoors, use housing or machining room.
Flood back	Suction line frozen Low compressor superheat	(There can be icing on suction lines on low SST applications.) Adjust TXV if it is determined to be the cause of low superheat at the compressor.
	Liquid coming back	Clean evaporator coil, evaporator fan (s) not working, coil iced up. On hot gas systems check valve at evaporator malfunction.

6.6 Troubleshooting (count'd)

Situation	Possible Cause	Trouble Shooting Steps
Compressor is running hot	High discharge	Check condenser is operating and clean.
	Suction temp high	Check return gas temperature.
	Compression ratio is too high	Check set points and application limits.
Oil failure trips	No oil at sightglass	Check for leaks and check piping. Possibility of improper traps and/or poor oil return on single compressor systems. See oil level low.
	Oil at normal level	Possibility of liquid refrigerant in the crankcase. Oil screen dirty on oil pump compressors. See oil level low.
	Oil sightglass full	Too much oil in the system.

Customer Forms

CF-0001 RETURN MATERIAL AUTHORIZATION (RMA) FORM

CF-0015 RECIP SYSTEM INFORMATION REQUEST

CF-0016 2-STAGE SYSTEM INFORMATION REQUIEST

	Parameter	Note
1	Suction Pressure/Temperature	Compressor Superheat
2	Discharge Pressure/Temperature	Discharge Superheat
3	Oil Temperature	
4	Oil Pressure Differential	+ HP (oil), - LP (crankcase)
5	Ambient Temperature	
6	Voltage/Operating current	
7	Liquid Temperature	Exiting Condenser/subcooler
8	Ambient/Fluid Temperature	Condenser
9	Liquid Temperature	Before TXV
10	Suction Gas Temperature	Exiting Evaporator
11	Air/Fluid Temperature	Evaporator

In order to properly assist with troubleshooting and technical support, Application Engineers will need as much information related to the compressor operation as possible. Bitzer can provide a form (CF-0015 or CF-0016) to document this information.

Key Compressor Operating Parameters

Compressor Superheat (SH): Adequate SH insures that liquid refrigerant is not returning to the suction side of the compressor. BITZER recommends 20°F - 30°F of SH at the compressor. SH can be calculated by subtracting the saturated suction temperature from the return gas temperature (Reference point 1).

Discharge Temperature: The discharge temperature should be measure 6" - 8" from the discharge service valve. The max discharge temperature is 250°F. High (or low) discharge temperatures indicate a compressor or system problem. The BITZER software or technical support can provide normal discharge temperatures.

Suction/Discharge Pressure/Temperature: Suction and discharges pressures and temperatures at the compressor can be used to determine compressor or system performance and calculate suction and discharge superheats. Minimum discharge SH is 54°F.

Oil Pressure Differential: For compressor models with oil pumps, the oil pressure differential is the difference between the high side of the oil pump (label +HP on the pump) and the crankcase pressure (-LP). Oil pump/compressor that are operating normally should have an oil pressure differential of 20 - 50psi. Minimum differential is 9psi.

Operating Voltage: When measured during operation, the voltage at each terminal pin should be within 2% of the others and 10% of the compressor nameplate voltage.

Operating Current: When measured during operation, the amperage at each terminal pin should be within 10% of the others.
